Innovation Report

A library's collection and resources were once entirely physical and kept on-site, now most library's collection and many of its resources are now digital. Patrons used to turn to books first for answers, nowadays they turn to the web and other online resources first. Finally, the internet and online resources are simply more convenient, faster, and easier to use than physical books and resources. Libraries are the main source of knowledge and information, it is important that libraries adapt to the digital age.

HTML, CSS, and JS is also essential for library staff to serve patrons effectively in the digital age. Given that the entire world has become increasingly digital, knowledge of HTML, CSS, and JS empowers library staff to guide patrons who come in with internet-related questions, whether those questions are from a patron with less internet experience who wants to know why a website is not working for them, or from a patron who is familiar with the internet and wants to get started building their own website or needs help fixing the code of a broken website on which the patron is working. Furthermore, knowing HTML, CSS, and JS allows libraries and their staff to give their patrons access to more resources and help needed.
